Improved durability

Improved bearing performance

A 70% longer wear ring length achieving an improvement in bearing performance compared to the CY1B.

Improved lubrication by using a Lube-retainer

A special resin Lube-retainer is installed on the dust seal to achieve ideal lubrication on the external surface of the cylinder tube.

Direct mount type **CY3R Series**

Upgraded version of space saving magnetically rodless cylinder!

Reduction of sliding resistance

Minimum operating pressure reduced by 30%

By using a Lube-retainer, the minimum operating pressure is reduced by 30%.

(CY3B40 compared with CY1B40)

■ CY3B Series ■

Small auto switches are mountable.

Small auto switches can be mounted on the current auto switch mounting groove of the CY3R25 to 63. So, they can be mounted to all of the cylinder sizes in the CY3R series, making inventory control of the product easy.

Lightweight

The body weight has been reduced by approximately 10% by eliminating unnecessary body weight and by reducing the outer diameter of the cylinder tube. (Compared with previous $\phi 50$ and $\phi 60$ models)

CY3B/CY3R Series Model Selection

E: Kinetic energy of load (J)

$$E = \frac{(W + W_a)}{2} \times \left(\frac{V}{1000} \right)^2$$

Es: Allowable kinetic energy for intermediate stop using an air pressure circuit (J)

Fn: Allowable driving force (N)

Mb: Maximum allowable moment (N·m) when a connection bracket, etc. is carried directly

Ps: Operating pressure limit for intermediate stop using an external stopper, etc. (MPa)

Pv: Maximum operating pressure for vertical operation (MPa)

Wbmax: Maximum load mass (kg) when loaded directly on the body

Wv: Allowable load mass for vertical operation (kg)

Operating Conditions	
W: Load mass (kg)	Switches
Wa: Connection bracket weight (kg)	P: Operating pressure (MPa)
μ: Guide's coefficient of friction	V: Speed (mm/s)
Lo: Distance from cylinder shaft center to workpiece point of application (cm)	Stroke (mm)
	Mode of operation (horizontal, inclined, vertical)
L: Distance from cylinder shaft center to connection fitting, etc. (mm)	

Precautions on Design 1

Selection Procedure

Selection procedure

1. Find the drive resisting force F_n (N) when moving the load horizontally.
2. Find the distance L_o (cm) from the point of the load where driving force is applied, to the center of the cylinder shaft.
3. Select the bore size from L_o and F_n , based on data (A).

Selection example

Given a load drive resisting force of $F_n = 100$ (N) and a distance from the cylinder shaft center to the load application point of $L_o = 8$ cm, find the intersection point by extending upward from the horizontal axis of data (A) where the distance from the shaft center is 8 cm, and then extending to the side, find the allowable driving force on the vertical axis.

Models suitable in satisfying the requirement of 100 (N) are **CY3□32** or **CY3□40**.

* The L_o point from the cylinder shaft center is the moment working point between the cylinder and the load section.

Precautions on Design 2

Cylinder Dead Weight Deflection

When the cylinder is mounted horizontally, deflection appears due to its own weight as shown in the data, and the longer the stroke is, the greater the amount of variation in the shaft center. Therefore, a connection method should be considered which can assimilate this deflection.

The above clearance amount is a reference value.

Note 1) According to the dead weight deflection in the figure on the right, provide clearance so that the cylinder does not touch the mounting surface or the load, etc., and is able to operate smoothly within the minimum operating pressure range for a full stroke. For more information, refer to operation manual.

Note 2) In case of the CY3R, install a shim, etc. to eliminate clearance between the body and the switch rail. For more information, refer to the CY3R operation manual.

Note 3) The amount of deflection differs from the CY1B/CY1R. Adjust the clearance value by referring to the dead weight deflection as shown in the table on the right.

When CY1B/CY1R are replaced with CY3B/CY3R, install a cylinder after confirming a full stroke and clearance are allowed.

Vertical Operation

It is recommended that the load is guided by a ball type bearing (linear guide, etc.). If a slide bearing is used, sliding resistance increases due to the load mass and moment, which may cause malfunctions.

When the cylinder is mounted vertically or on an angle and is to make intermediate stops, use an external stopper, etc., for positioning. In addition, as the slider may move downwards toward the stroke end due to self-weight or the mass of the workpiece, use an external stopper, etc., for positioning if accurate positioning is required.

* The above deflection data represent values at the time when the external sliding part moves to the middle of the stroke.

Maximum Weight of Connection Bracket to the Body

The CY3B series is guided by an external axis (such as a linear guide) without directly mounting the load. When designing a metal bracket to connect the load, make sure that its weight will not exceed the value in the table below. Basically, guide the CY3R direct mounting type also with an external axis. (For connection methods, refer to the Operation Manual.)

Max. Connection Bracket Weight

Model	Max. connection bracket weight (W _{max}) (kg)
CY3_6	0.2
CY3_10	0.4
CY3_15	1.0
CY3_20	1.1
CY3_25	1.2
CY3_32	1.5
CY3_40	2.0
CY3_50	2.5
CY3_63	3.0

Consult with SMC in case a bracket with weight exceeding the above value is to be mounted.

<CY3R>

Maximum Load Mass when Loaded Directly on Body

When the load is applied directly to the body, it should be no greater than the maximum values shown in the table below.

Model	Max. load weight (W _{max}) (kg)
CY3R6	0.2
CY3R10	0.4
CY3R15	1.0
CY3R20	1.1
CY3R25	1.2
CY3R32	1.5
CY3R40	2.0
CY3R50	2.5
CY3R63	3.0

Bore size (mm)	Model	Allowable load mass (W) (kg)	Max. operating pressure (P _v) (MPa)
6	CY3_6	1.0	0.55
10	CY3_10	2.7	0.55
15	CY3_15	7.0	0.65
20	CY3_20	11.0	0.65
25	CY3_25	18.5	0.65
32	CY3_32	30.0	0.65
40	CY3_40	47.0	0.65
50	CY3_50	75.0	0.65
63	CY3_63	115.0	0.65

* Use caution, as there is a danger of breaking the magnetic coupling if operated above the maximum operating pressure.

Precautions on Design 3

Intermediate Stop

(1) Intermediate stopping of load with an external stopper, etc.

When stopping a load in mid-stroke using an external stopper, etc., operate within the operating pressure limits shown in the table below. Use caution, as operation at a pressure exceeding these limits can result in breaking of the magnetic coupling.

Bore size (mm)	Model	Operating pressure limit for intermediate stop (Pa) (MPa)
6	CY3□6	0.55
10	CY3□10	0.55
15	CY3□15	0.65
20	CY3□20	0.65
25	CY3□25	0.65
32	CY3□32	0.65
40	CY3□40	0.65
50	CY3□50	0.65
63	CY3□63	0.65

(2) Intermediate stopping of load with an air pressure circuit

When performing an intermediate stop of a load using an air pressure circuit, operate at or below the kinetic energy shown in the table below. Use caution, as operation when exceeding the allowable value can result in breaking of the magnetic coupling.

(Reference values)

Bore size (mm)	Model	Allowable kinetic energy for intermediate stop (Es) (J)
6	CY3□6	0.007
10	CY3□10	0.03
15	CY3□15	0.13
20	CY3□20	0.24
25	CY3□25	0.45
32	CY3□32	0.88
40	CY3□40	1.53
50	CY3□50	3.12
63	CY3□63	5.07

Stroke End Stopping Method

When stopping a load having a large inertial force at the stroke end, tilting of the body and damage to the bearings and cylinder tube may occur. (Refer to the left hand drawing below.)

As shown in the right hand drawing below, a shock absorber should be used together with the stopper, and thrust should also be transmitted from the center of the body so that tilting will not occur.

Note) The drawing shows the CY3R series.

<CY3R>

Body Non-rotating Accuracy and Maximum Allowable Moment (with Switch Rail)

(Reference values)

Reference values for non-rotating accuracy and maximum allowable moment at stroke end are indicated below.

Bore size (mm)	Non-rotating accuracy (°)	Max. allowable moment (M ₀) (N·m)	Allowable stroke (mm) ^{Note 2)}
6	7.3	0.02	100
10	6.0	0.05	100
15	4.5	0.15	200
20	3.7	0.20	300
25	3.7	0.25	300
32	3.1	0.40	400
40	2.8	0.62	400
50	2.4	1.00	500
63	2.2	1.37	500

Note 1) Avoid operations where rotational torque (moment) is applied. In such a case, the use of an external guide is recommended.

Note 2) The above reference values will be satisfied within the allowable stroke ranges, but caution is necessary, because as the stroke becomes longer, the inclination (rotation angle) within the stroke can be expected to increase.

Note 3) When a load is applied directly to the body, the loaded weight should be no greater than the allowable load weight on page 1180.

* Other than the applicable auto switches listed in "How to Order", the other auto switches can be mounted. For detailed specifications, refer to page 1193.
 * With pre-wired connector is also available in solid state auto switches. For specifications, refer to pages 1358 and 1359.
 * The auto switch is shipped together, but not assembled.

Note 1) When an auto switch is installed at an intermediate position of a type with auto switch, keep the maximum piston speed at 300 mm/s or below to ensure operation of relays or other devices.

Note 2) When vertically mounting, it is impossible to perform an intermediate stop by means of a pneumatic circuit.

1 Hydro Specifications

Symbol

-X116

This type is applicable for precision constant speed feed, intermediate stop and skip feed.

Specifications

Type	Basic type, Direct mount type
Bore size	Basic type CY3B25 to 63, CY3R25 to 63
Fluid	Turbine oil
Piston speed	15 to 300mm/s

Note) Piping is from each plate on both sides.

2 Air Supply Port Relocated in Axial Direction

Symbol

-X132

The air supply port has been changed to an axial position on the head cover.

Specifications

Applicable series	CY3B
Bore size	ø6 to ø63

The port size is the same as the standard type.

3 High Speed Specifications Symbol **-X160**

CY3B Bore size Port thread type - Stroke - X160
 CY3R

High speed specifications

This makes a high speed piston drive of 1,500 mm/s possible (basic type, without load), but it is not applicable for all conditions. Consult with SMC for the operating conditions, etc.

Specifications

Applicable series	CY3B/CY3R
Bore size	ø20 to ø63
Piston speed (no load)	1500 mm/s (MAX)

- Note 1) When operating this cylinder at high speed, a shock absorber must be provided.
- Note 2) For the CY3R, only the piping on both sides can be made.
- Note 3) The piston speed may vary depending on the operating conditions. For details, contact SMC or your nearest sales representative.
- Note 4) Speed tends to decrease over a period of time depending on the operating conditions. Apply grease periodically if necessary.

5 Added Mounting Tap Positions for Slider Symbol **-X206**

CY3B Bore size Port thread type - Stroke - X206

Added mounting tap positions for slider

Mounting taps have been added on the surface opposite the standard positions.

Specifications

Applicable series	CY3B
Bore size	ø6 to ø63

* Dimensions are the same as the standard product.

4 Helical Insert Thread Specifications Symbol **-X168**

CY3B Bore size Port thread type - Stroke - X168

Helical insert thread specifications

Helical insert thread is used for standard mounting thread.

Specifications

Applicable series	CY3B
Bore size	CY3B: ø20 to ø63

6 Non-lubricated Exterior Specifications Symbol **-X210**

CY3B Bore size Port thread type - Stroke - X210

Non-lubricated exterior specifications

Suitable for environments where oil is not tolerated. It is recommended to use this type in a special environment where standard product causes lubrication failure.

Note) Consider installing a protective cover if the product is used in an environment where foreign matter such as paper powder might be caught in the sliding parts of the cylinder.

7 Outside of Cylinder Tube with Hard Chrome Plated Symbol **-X322**

CY3B Bore size Port thread type — Stroke — **X322**

Outside of cylinder tube with hard chrome plated

The cylinder tube outer circumference is plated with hard chrome, which further reduces bearing abrasion.

* Be sure to install a shock absorber to the stroke end.

Note 1) The maximum stroke is 3,500 st, or the maximum stroke for the standard type.

CY3R is compatible with the maximum stroke for the standard type.

Note 2) When exceeding 2,000 strokes, contact SMC separately.

8 Non-lubricated Exterior Specifications (with Dust Seal) Symbol **-X324**

CY3B Bore size Port thread type — Stroke — **X324**

Non-lubricated exterior specifications (with dust seal)

No grease is applied to the external surface of the cylinder. Suitable for environments where oil is not tolerated.

A felt dust seal is mounted to the external sliding part of the cylinder tube.

Note) Although a felt dust seal is installed, foreign matter might be caught in the sliding parts of the cylinder. In that instance, consider installing a protective cover.

9 Interchangeable with CY1□6 Symbol **-X1468**

CY3B Bore size Port thread type — Stroke — **X1468**

Interchangeable with CY1□6

Can be interchanged with CY1□6.

Specific Product Precautions 1

Be sure to read this before handling the products.

Refer to page 8 for safety instructions and pages 9 to 18 for actuator and auto switch precautions.

Handling

⚠ Warning

1. Pay attention to the space between the head cover and the body.

Take sufficient care to avoid getting your hands or fingers caught when the cylinder is operated.

2. Do not apply a load to a cylinder which is greater than the allowable value stated in the Model Selection.

Applying an improper load may cause malfunctions.

3. Do not use the cylinder in an environment where the cylinder is expose to moisture, adhesive foreign matter, dust or liquid such as water or cutting fluid.

If the cylinder is used in an environment where the lubrication of the cylinders sliding parts is compromised, please consult SMC.

4. When applying grease to the cylinder, use the grease that has already been applied to the product. Contact SMC for available grease packs.

Mounting

⚠ Caution

1. Take care to avoid nicks or other damage on the outside surface of the cylinder tube.

This can lead to damage of the wear ring and lubretainer, which in turn can cause malfunction.

2. Take care regarding rotation of the external slider.

Even when the rotation is controlled by connecting the external slider to other shaft (linear guide, etc.), keep it in the floating connection status.

3. Do not operate with the magnetic coupling out of position.

In case the magnetic coupling is out of position, push the external slider back into the correct position by hand at the end of the stroke (or correct the piston slider with air pressure).

4. The cylinder is mounted with bolts through the mounting holes in the end covers. Be sure they are tightened securely. (CY3R)

5. If gaps occur between the mounting surface and the end covers when mounting with bolts, perform shim adjustment using spacers, etc. so that there is no unreasonable stress. (CY3R)

6. Be sure that both end covers are secured to the mounting surface before operating the cylinder.

Avoid operation with the external slider secured to the surface.

Mounting

⚠ Caution

7. Do not apply a lateral load to the external slider.

When a load is mounted directly to the cylinder, variations in the alignment of each shaft center cannot be assimilated, which results in the generation of a lateral load that can cause malfunction. (Figure 1) The cylinder should be operated using a connection method which allows for assimilation of shaft alignment variations and deflection due to the cylinder's own weight. A drawing of a recommended mounting is shown in Figure 2.

Variations in the load and cylinder shaft alignment cannot be assimilated, resulting in malfunction.

Shaft alignment variations are assimilated by providing clearance for the mounting bracket and cylinder. Moreover, the mounting bracket is extended above the cylinder shaft center, so that the cylinder is not subjected to moment.

Figure 1. Incorrect mounting

Figure 2. Recommended mounting

Note) The drawing shows the CY3B series.

8. Use caution regarding the allowable load mass when operating in a vertical direction.

The allowable load mass when operating in a vertical direction (reference values on page 1180) is determined by the model selection method, however, if a load greater than the allowable value is applied, the magnetic coupling may break and there is a possibility of dropping the load. When using this type of application, contact SMC regarding the operating conditions (pressure, load, speed, stroke, frequency, etc.).

9. Careful alignment is necessary when connecting to a load having an external guide mechanism.

As the stroke becomes longer, variations in the center axis become larger. Consider using a connection method (floating mechanism) that is able to absorb these variations. Furthermore, use the special floating brackets (XC57) which have been provided for the CY3B and CY3R series (page 1552).

Specific Product Precautions 2

Be sure to read this before handling the products.

Refer to page 8 for safety instructions and pages 9 to 18 for actuator and auto switch precautions.

Disassembly & Maintenance

⚠ Warning

1. Use caution as the attractive power of the magnets is very strong.

When removing the external slider and piston slider from the cylinder tube for maintenance, etc., handle with caution, since the magnets installed in each slider have very strong attractive power.

⚠ Caution

1. When reattaching the head covers after disassembly, confirm that they are tightened securely. (CY3B)

When disassembling, hold the wrench flat section of one head cover with a vise, and remove the other cover using a spanner or adjustable angle wrench on its wrench flat section. When retightening, first coat with Locktight (No. 542 red), and retighten 3 to 5° past the original position prior to removal.

2. Special tools are necessary for disassembly. (CY3R)

Special Tool Number List

Part no.	Applicable bore size (mm)
CYRZ-V	6, 10, 15, 20
CYRZ-W	25, 32, 40
CYRZ-X	50
CYRZ-Y	63

3. Use caution when taking off the external slider, as the piston slider will be directly attracted to it.

When removing the external slider or piston slider from the cylinder tube, first force the sliders out of their magnetically coupled positions and then remove them individually while there is no longer any holding force. If they are removed when still magnetically coupled, they will be directly attracted to one another and will not come apart.

4. Do not disassemble the magnetic components (piston slider, external slider).

This can cause a loss of holding force and malfunction.

5. When disassembling to replace the seals and wear ring, refer to the separate disassembly instructions.

Disassembly & Maintenance

⚠ Caution

6. Note the direction of the external slider and piston slider.

Since the external slider and piston slider are directional for $\phi 6$ and $\phi 10$, refer to the figures below when performing disassembly or maintenance. Put the external slider and piston slider together, and insert the piston slider into the cylinder tube so that they will have the correct positional relationship as shown in Figure 3. If they align as shown in Figure 4, insert the piston slider after turning it around 180°. If the direction is not correct, it will be impossible to obtain the specified holding force.
